PROFESSIONAL SUMMARY

Full-stack Software Developer who builds across the frontend and backend — from a framework-free JavaScript/WebGL portfolio site to Go HTTP servers and a Python trading system that integrates the Gemini AI API for signal analysis. Applies a quantitative, systems-first approach from an Economics background to breaking problems down and reasoning through trade-offs. Comfortable in Go, Python, and JavaScript; currently deepening Python for AI-integrated applications.

TECHNICAL SKILLS

- Languages:** Python, Go, JavaScript, HTML, CSS
- AI Integration:** Google Gemini API (signal/sentiment analysis), prompt-driven decision logic, confidence-weighted signal blending
- Backend & Systems:** REST API integration, HTTP servers, file I/O & stream processing, table-driven & unit testing
- Frontend:** Responsive, framework-free UI development; WebGL basics; Next.js
- Tools & Environment:** Git, GitHub, Linux (WSL), VS Code, Vercel, Supabase (Postgres-backed BaaS)

SELECTED PROJECTS

- AI-Assisted Forex Trading Bot | Python, MetaTrader5 API, Gemini AI** (private repo)
- Built a trading system on MetaTrader 5 combining EMA/RSI/MACD/ATR technical signals with a Gemini AI news-sentiment overlay into a weighted confidence score; runs live across 4 instruments on a demo account with a tiered trailing-stop risk manager.
 - Diagnosed and fixed 8 production bugs via live trading logs, including a stop-loss sign-inversion defect and a 100x unit error in gold pip sizing.
 - Validated exit parameters with bar-by-bar backtest simulation (150+ trades/instrument) and walk-forward out-of-sample splits; built a 28-test suite across 7 files covering position management and risk gates.

- Personal Finance Tracker | Next.js, Supabase** (in progress)
- Building an expense-tracking application focused on clean data modeling and a simple interface for visualizing monthly spending trends.

- Personal Developer Portfolio | JavaScript, CSS, HTML, WebGL** (live — danielsunday.name.ng)
- Designed and hand-built a visually distinctive, framework-free portfolio site — custom layout, typography, and interaction design coded directly rather than assembled from a template or UI kit.
 - Created a pointer-reactive WebGL background and glowing card-hover effect, porting the interaction from a React component library into vanilla JavaScript to keep the visual polish without any framework weight.
 - Tuned visual performance by compressing images and locking in explicit dimensions, so the site stays fast and stable while still looking sharp.

- ASCII Art Suite & Web Engine | Go**
- Built a suite of Go CLI tools around a custom ASCII-art rendering engine (color rendering, banner styles, alignment modes), then extended it into a web app using native Go HTTP handlers and the embed/template packages.
 - Wrote table-driven unit tests covering rendering accuracy, edge cases, and file-system interaction.

- Go Stream-Based Text Processor | Go**
- Built a stream-processing CLI for typography correction, macro/token parsing, case transformation, and binary/hexadecimal conversion, using buffered readers/writers for line-by-line processing.

WORK EXPERIENCE

- Software Developer — Learn2Earn, Abuja, Nigeria** Feb 2026 – Present
- Selected into a project-driven software engineering fellowship founded by Iyinoluwa Aboyeji (Andela, Flutterwave); build backend tools in Go, JavaScript, and Python alongside peers, following modern testing and deployment workflows.
 - Participate in regular code reviews and apply feedback to ship maintainable code.

- Real Estate Agent — Dancel Jovic Integrated International Ltd, Abuja, Nigeria** 2023 – 2025
- Advised clients on property acquisitions and negotiated lease/purchase terms while maintaining accurate records.

EDUCATION

- B.Sc. Economics (Second Class Honours, Upper Division) — Bingham University, Nasarawa, Nigeria** Graduated October 2023
